Self-aligning linear ball bearings

Features

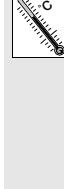

Self-aligning linear ball bearings

- are units comprising a housing, movable segments and seals
 - housing in closed or open design
 - segments comprise a segment upper section, load plate, rolling elements (balls) and a segment lower section including the ball recirculation tracks
- automatically compensate misalignments of the bearing central axis due to the movable segments. Shaft misalignments of up to max. ± 40 angular minutes are therefore possible without impairing the bearing load carrying capacity or operating life
- have no reduction in load ratings due to edge pressure within the shaft misalignment tolerance, and can therefore support considerably higher loads than non-aligning linear ball bearings of the same diameter
- run very quietly and with very low friction due to
 - the automatic compensation of misalignments
 - ground rolling element raceways in the load plates
- run without stick-slip – as compared with plain bearings – and are therefore suitable even for applications requiring high positional accuracy
- allow high speeds up to 5 m/s and accelerations up to 100 m/s²
- allow the construction of linear guidance systems with unlimited travel
- are sealed on both sides by gap seals or contact seals with a floating support arrangement
 - open linear ball bearings also have integral sealing strips on both sides
- sealed versions are supplied greased and are maintenance-free in many applications due to the integral lubricant reservoir
- are dimensioned so that they can replace conventional linear ball bearings even in existing applications
- can be supplied combined with housings as housing units
- are suitable for use with supported shafts in the open version and with the appropriate housing
- have adjustable clearance and can be preloaded in conjunction with open, slotted housings
- can be combined with INA housings and shafts or shaft and support rail units to achieve optimally matched, ready-to-fit, particularly cost-effective complete linear solutions with a long operating life
- are also produced in inch dimensions (series KX, KXO, see *INA Market Information MAI 70*).

- self-aligning linear ball bearings, closed design
 - KS with gap seals ① on both sides
KS..-PP with lip seals ② on both sides
 - for operating temperatures up to +80 °C
 - for shaft diameters from 12 mm to 50 mm
- self-aligning linear ball bearings, open design, for supported shafts
 - KSO with gap seals ① on both sides
KSO..-PP with lip seals ② on both sides
 - integral gap type sealing strips
 - for operating temperatures up to +80 °C
 - for shaft diameters from 12 mm to 50 mm

Self aligning linear ball bearings

Units – tandem arrangement

KTSG
KTSS

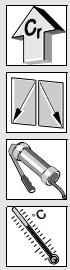

120 381

- housing made from high strength aluminium alloy, fitted with two self-aligning linear ball bearings KS..-PP in tandem arrangement, bearings can be relubricated
- KTSS slotted and with adjustable clearance
- for operating temperatures up to +80 °C
- for shaft diameters from 12 mm to 30 mm

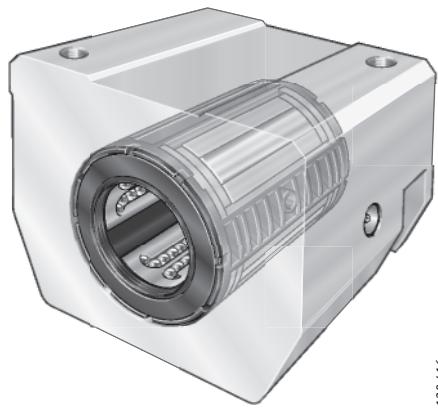

14

Units

KGSNG
KGSNS

120 416

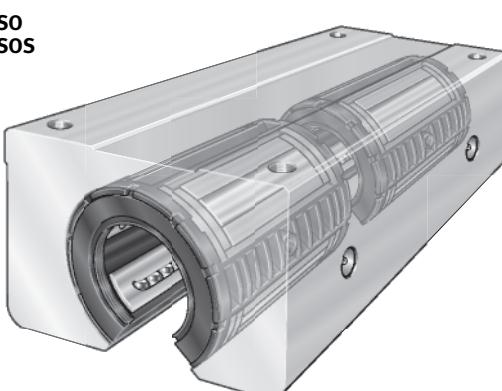

- housing made from high strength aluminium alloy, fitted with self-aligning linear ball bearing KS..-PP, bearing can be relubricated
- KGSNS slotted and with adjustable clearance
- for operating temperatures up to +80 °C
- for shaft diameters from 12 mm to 50 mm

10

KTSO
KTSOS

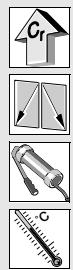

120 394

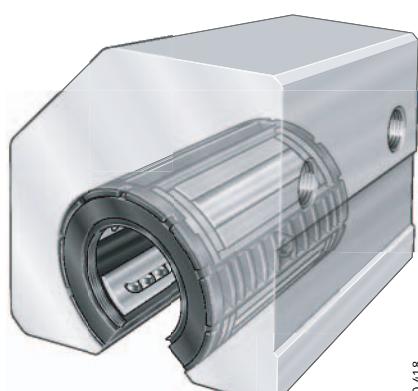

- housing made from high strength aluminium alloy, open design, suitable for supported shafts, fitted with two self-aligning linear ball bearings KSO..-PP in tandem arrangement, bearings can be lubricated
- KTSOS slotted and with adjustable clearance
- for operating temperatures up to +80 °C
- for shaft diameters from 12 mm to 30 mm

16

KGSC
KGSCS

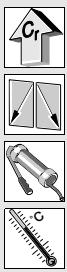

120 418

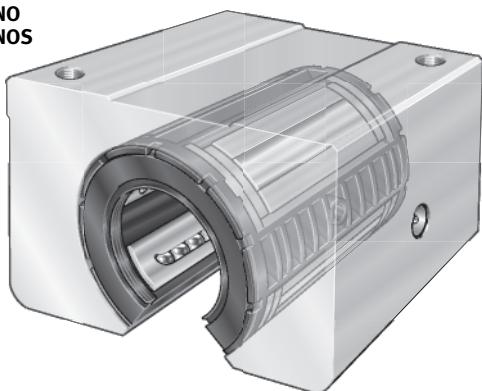

- housing made from high strength aluminium alloy, open design, suitable for supported shafts, fitted with self-aligning linear ball bearing KSO..-PP, bearing can be lubricated
- KGSCS slotted and with adjustable clearance
- for operating temperatures up to +80 °C
- for shaft diameters from 20 mm to 50 mm

18

KGSNO
KGSNOS

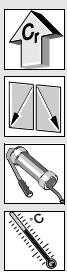

120417

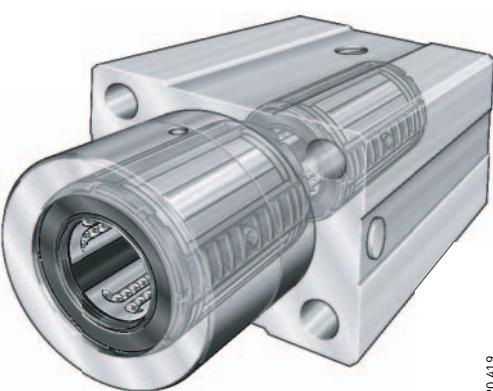

- housing made from high strength aluminium alloy, open design, suitable for supported shafts, fitted with self-aligning linear ball bearing KSO..-PP, bearing can be lubricated
- KGSNOS slotted and with adjustable clearance
- for operating temperatures up to +80 °C
- for shaft diameters from 12 mm to 50 mm

12

Units – tandem arrangement

KTFS

120419

- housing made from high strength aluminium alloy, fitted with two self-aligning linear ball bearings KS..-PP in tandem arrangement, bearings can be relubricated
- for operating temperatures up to +80 °C
- for shaft diameters from 12 mm to 30 mm

20

Shafts

Features

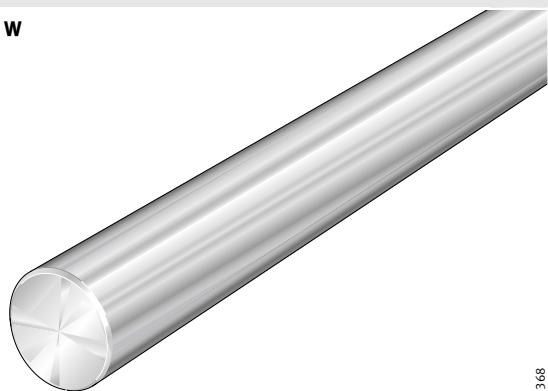

Shafts

- are precision raceways for INA linear ball bearings
- are made from quenched and tempered steel with a surface hardness of 670 HV + 170 HV (59 HRC + 6 HRC)
 - the uniform hardness depth ensures a smooth transition from the hardened surface layer to the tough core
- can be loaded up to the full basic load rating of INA self-aligning linear ball bearings
- are produced as standard in tolerance class h6
- have high accuracy (roundness and parallelism)
- can be supplied in single pieces up to 6 000 mm in length – depending on the diameter
 - longer lengths are available by agreement
 - the shaft ends are chamfered after cutting to length
- can also be supplied in a special version with ends that differ from the standard version
- can be produced with axial or radial threaded holes for fixing (see *Threaded holes*)
- allow the construction of linear guidance systems with high load carrying capacity, high rigidity, high accuracy and a long operating life
- can be combined with INA linear ball bearings or INA linear ball bearing units to achieve optimally matched, ready-to-fit, particularly cost-effective shaft guidance systems
- are used not only as raceways for INA linear ball bearings but also as:
 - guide rods for plain bushes
 - column guides for stud and yoke type track rollers
 - drawing and straightening rollers
 - shafts and axles in a wide variety of different applications.

Shafts

W

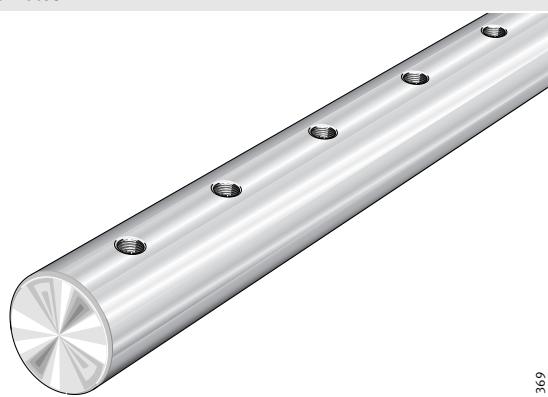

120368

- high precision solid shaft made from quenched and tempered steel
- standard tolerance h6
 - special tolerances available by agreement
- diameters from 5 mm to 80 mm

22

Threaded holes

120369

- recommended radial and axial threaded holes for fixing of high precision solid shafts W
 - for possible combinations see *Dimension table*
- shaft diameters from 5 mm to 80 mm

23

Design of bearing arrangements

Operating clearance

The operating clearance of linear bearings is defined by the selection of shaft and housing tolerances.

The operating clearance of linear bearing and housing units is either defined by shaft selection or, in the case of split housings, is set using the adjusting screw.

If the housings are not rigid, tests must be carried out to determine the housing and shaft tolerance required to achieve the required operating clearance.

Light range

Bearings KS, KS..-PP, KSO, KSO..-PP:

Slight preload is achieved with shafts to h6 and a housing bore to H7.

Units KTSG, KTSO, KGSNG, KGSC, KGSNO, KTFS:

Slight preload is achieved with shafts to h6.

Units KTSS, KTSOS, KGSNS, KGSCS, KGSNOS:

The clearance can be adjusted using a screw.

1) Dimensions A₆ on diameter d.

2) Dimensions and lubrication hole symmetrical with bearing width C.

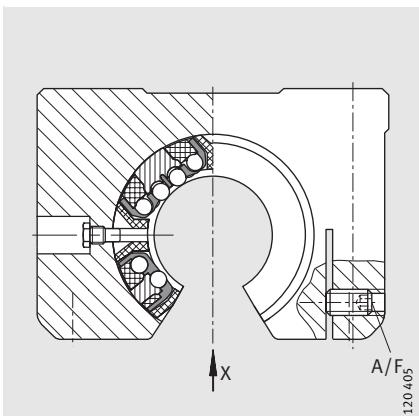

3) For fixing screws to EN ISO 4762-8.8.

If there is a possibility of settling, the fixing screws should be secured against rotation.

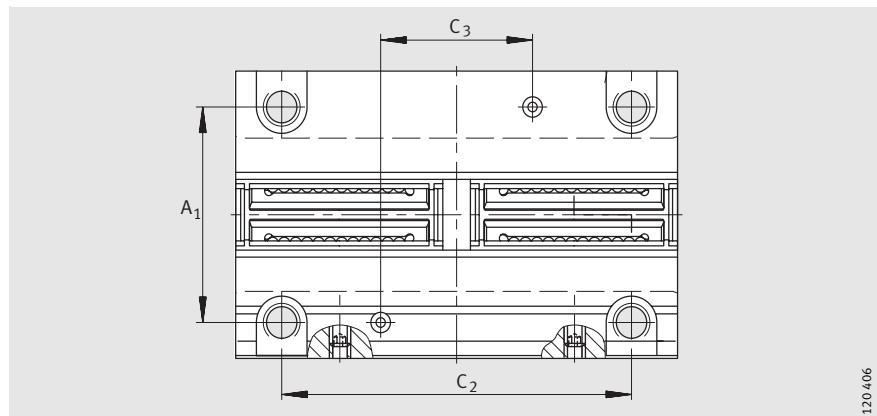

4) Lubrication nipple.

5) The basic load ratings apply only to hardened (670 HV + 170 HV) and ground shaft raceways.
Basic load ratings in accordance with DIN 636-1.

6) Centring hole to DIN 332, type A.
